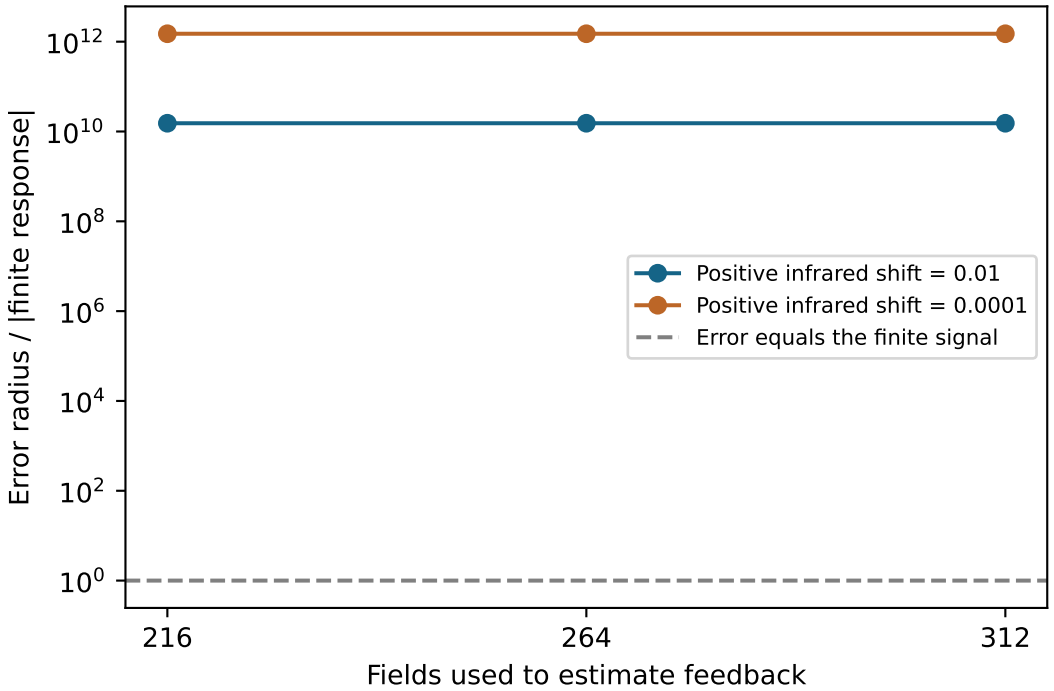
A useful error test rejects a shortcut to the physical source

This bound is too wide to decide the sign



Saved bridge + exterior fields
216 retained patterns, one angular sector

What the calculation adds
A bound on feedback from the full operator into this finite-rank source insertion

What is still missing
The omitted source insertion and sectors; controlled integration and infrared errors

Outcome
No supporting stress or time passage established

Conditional floating-matrix bounds at phase 0, kappa D = 0.7, MD = 1; not a continuum certificate.
