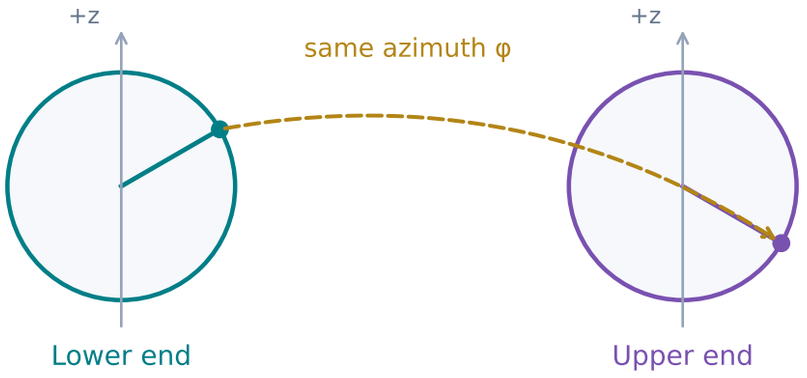
Separate the end connection from the added angular sectors

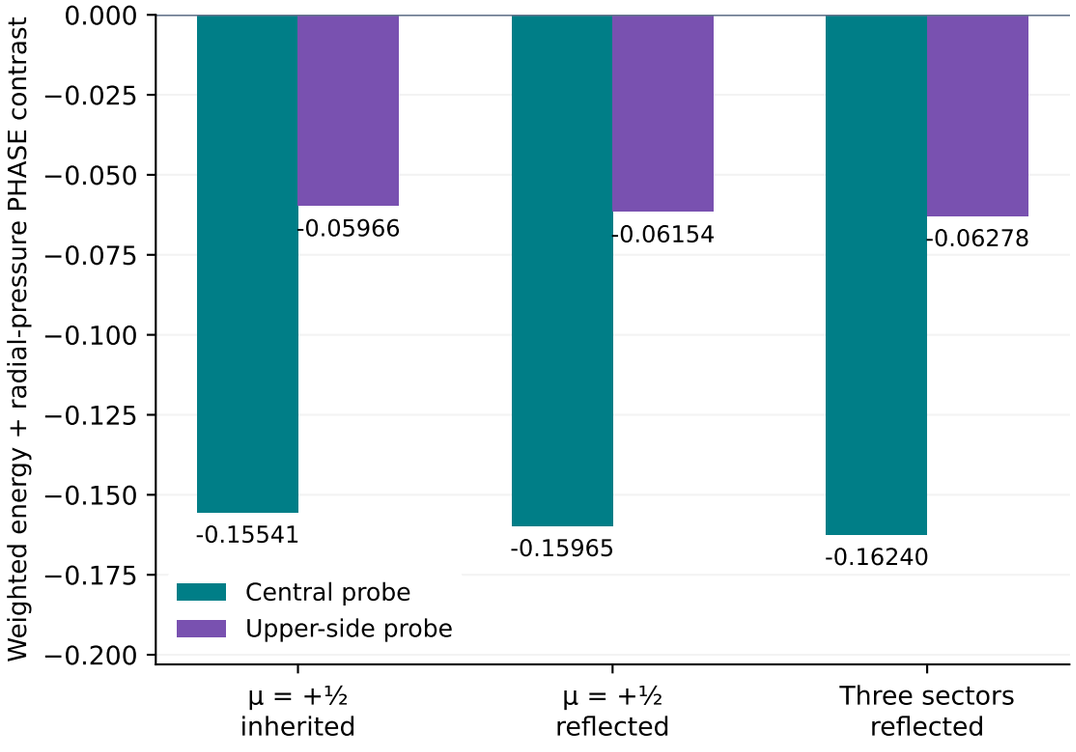
Specified sphere / product-frame geometry · Both Weyl components solved · Phase π minus phase 0

A. Declared angular identification — schematic



$\theta_U = \pi - \theta_L$ · Spin frame transformed too

B. Connection change, then added sectors



Same mesh and quadrature in all three comparisons.

Reflected connection: separate sector contributions

Sector μ	Central probe	Upper-side probe
-0.5	-0.000580983	-0.000261802
+0.5	-0.159645	-0.0615438
+1.5	-0.00217753	-0.00096992

Raw weighted responses; $\hbar$ = c = d = 1. Window 1e-06 ≤ κd ≤ 12, h/d = 0.05.

Partial-sum sensitivity: latest matched mesh change 0.00062; observed frequency-panel change 1.73e-09. Neither is a certified bound.

Only three azimuthal sectors: higher angular content, the physical junction and the absolute supporting source remain unresolved.

No stable medium or 13 Sep 2027 → 12 Sep 2027 passage demonstrated.
