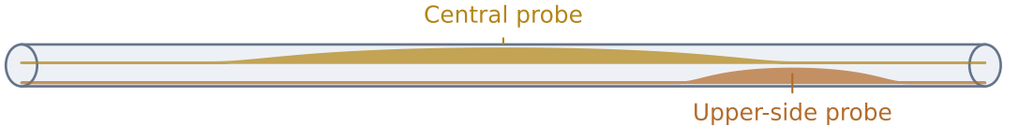
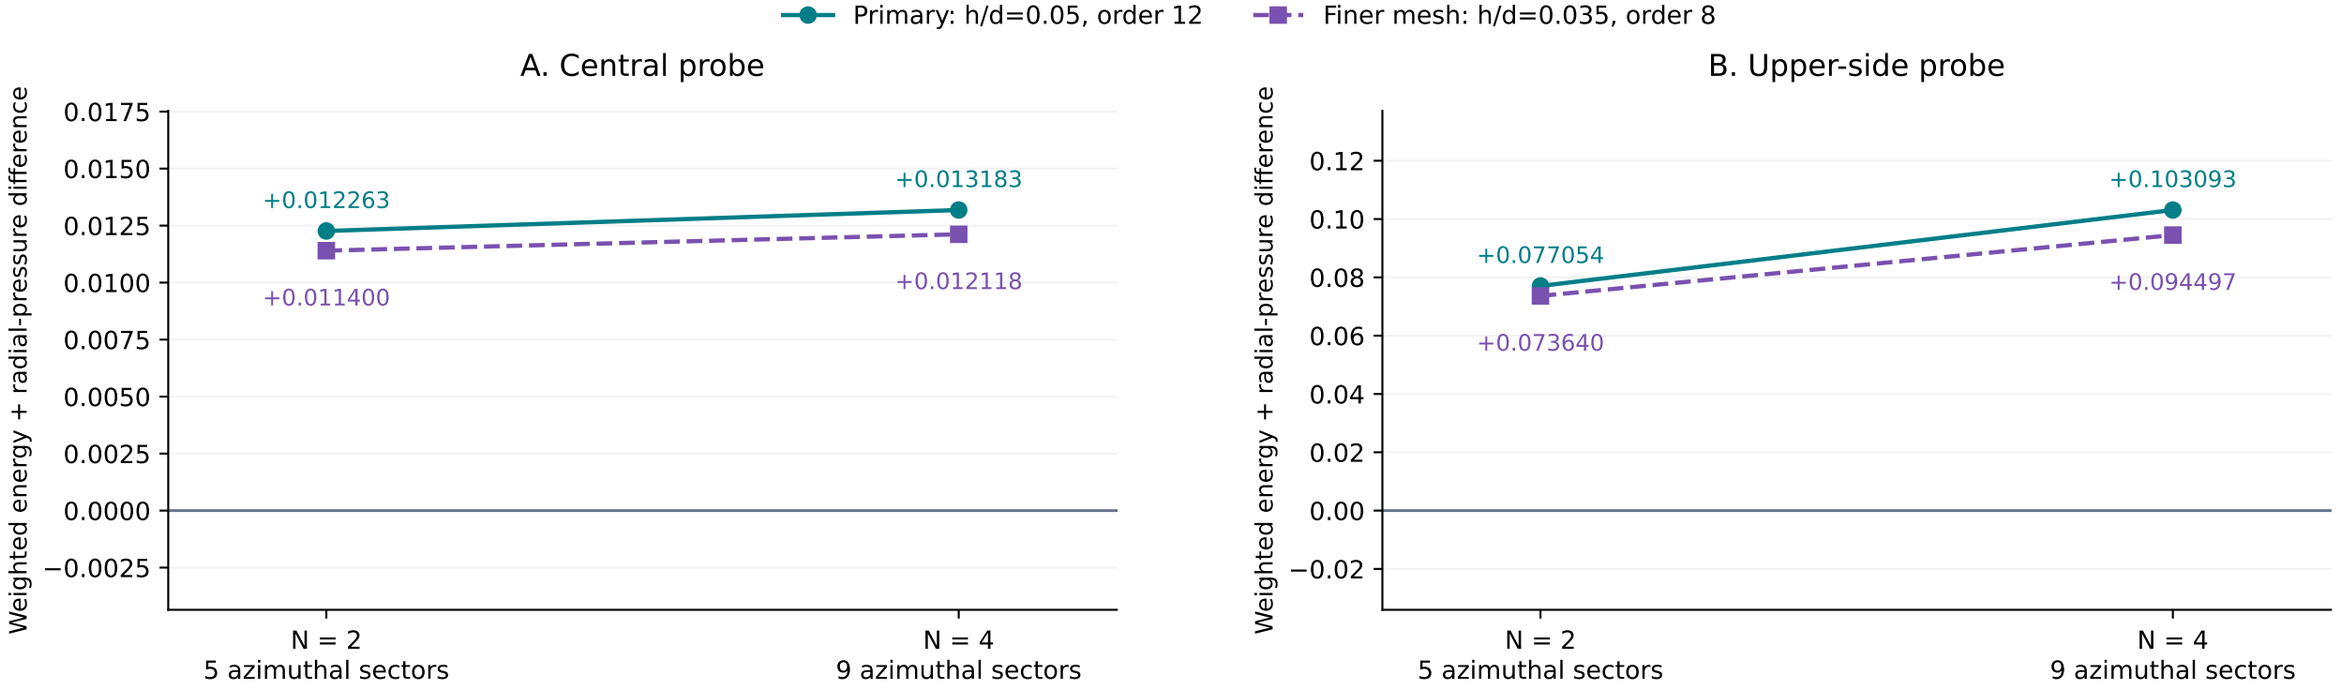
Comparing complete finite angular sums

Phase π · Connected minus invariant AdS reference · Same prescribed core and endpoint connection

Prescribed core and compact probes



Assumed geometry; not a constructed medium



All m = −N,…,N at each finite mouth cutoff; outer angular cutoff J = 9 is held fixed.

Both Weyl components; $\hbar = c = d = 1$; finite frequency window 1e-06 ≤ κd ≤ 96.

N=2 → 4 changes: +0.00092 central, +0.026 upper. N=4 matched-order mesh changes: -0.00106, -0.0086.

N=4 frequency-panel sensitivity: 1.5e-09. Cutoff and mesh changes are diagnostics; omitted angular/frequency tails have no certified bound.

Complete finite multiplets do not establish the infinite angular sum, absolute supporting stress, a physical junction or stability.

No stable medium or 13 Sep 2027 → 12 Sep 2027 passage demonstrated.
